

Problem 3 Solution

The statement is true

proof:- Case I n is odd

$\implies n + 1$ is even

$\implies n(n + 1)$ is even

$\implies n(n + 1) + 1$ is odd

$\implies n^2 + n + 1$ is odd

Case II: n is even

$\implies n(n + 1)$ is even

$\implies n(n + 1) + 1$ is odd

$\implies n^2 + n + 1$ is odd

Hence the statement is correct $\forall n \in \mathbb{Z}$
